

iTind Clinical Data

Clinical data demonstrate that after the iTind implant is removed it can provide long-lasting relief of BPH symptoms such as:

- Rapid & effective relief from BPH symptoms
- Lower risk profile than more invasive procedures
- Preserves sexual & ejaculatory function

MT-08 Clinical Study

Patient Information

90% of men suffer from BPH symptoms at some point in their life

Are urinary problems interfering with the quality of your life?

Suffering from the following symptoms?

- Frequent urination or UTI's
- Painful or difficulty urinating
- Interrupted sleep
- Unable to empty bladder fully
- Leakage & More

If you are experiencing some or all of these symptoms, you may have **Benign Prostatic Hyperplasia, or BPH**.

What is BPH?

BPH is a non-cancerous condition in men where the prostate is enlarged and presses on the urethra* causing chronic and troublesome urinary tract symptoms that can severely affect your quality of life. It's a common condition that affects millions of men around the world.

*The urethra is a vessel which carries urine from the bladder outside the body and runs through the prostate gland.

If your doctor has diagnosed you with BPH, you may be **eligible to participate in a Clinical Research Study** investigating a minimally invasive method for treating BPH.

MT-08 Clinical Study

Olympus Corporation of the Americas is sponsoring a clinical research study for treating BPH symptoms comparing two alternative treatments to medication or invasive surgery:

- ❖ If you participate in this voluntary study, you will be treated with an FDA-approved implant, either iTind or an alternative implant
- ❖ Both implants have been previously studied and shown to be safe and effective treatments for BPH

- ❖ The study is currently ongoing and recruiting patients. There are 20 study centers globally, and a total of 206 patients will participate
- ❖ Aim is to compare safety and effectiveness of the two implants in relieving the symptoms of BPH

Do I Qualify for this Clinical Study?

- You are 50 years & older
- Diagnosed with benign prostatic hyperplasia causing urination problems

What do I have to do if I participate?

- Your doctor will review your medical history and make sure you meet all study participation criteria
- You will need to complete the required screening tests and procedures
- Following your treatment, you will be followed up for 5 years and should comply with your provider's instructions

What is the iTind Implant Procedure?

iTind is a minimally invasive treatment with a small metal implant placed into the prostatic urethra to reshape the enlarged prostate tissue. It creates a wider channel in the urethra through which urine can flow freely, without burning or cutting out tissue surgically. The implant is temporary and is removed after 5-7 days. It provides immediate and lasting results & does not require hospitalization.
